Q: What is the page number?
Gold: 6

6

Lysine Levels
(as examples only)

Threonine Levels
(as examples only)

	0.05%	0.10%	0.15%
0.10%	9 animals	9 animals	9 animals
0.20%	9 animals	9 animals	9 animals
0.30%	9 animals	9 animals	9 animals

Each group of 9 animals will be divided into 3 groups of 3 animals each, and these groups will receive the supplemented rice at three different levels in the diet for a period of 21 days. In each such assay, three groups of 6 animals each will receive three different levels of lactalbumin as the standard protein. Food intake (to determine protein intake) will be determined in all animals. The regression analysis to determine the dose-response curves and the comparison of the slope ratios and error of the estimate will be performed by a computer program which has been developed recently. These data will provide estimates of the amounts of lysine and threonine required to yield a product with maximal nutritive value.

Phase II can begin as soon as the rice samples collected in Phase I are received in Boston. Preliminary results should be
